application: 2D CDT

Isotropy Observables

Definition of Isotropy

How the story goes
for Isotropy

Conclusions

Due to the very non-smooth nature of the path integral configurations, there is no hope to use tensor calculus in the resulting space-times. All the tools we have to study space-time, are distances and volumes!

Toy model
application: 2D CDT

Isotropy Observables

Definition of Isotropy

How the story goes
for Isotropy

Conclusions

Can we, using this emergent de Sitter-like Universe, somehow justify the usually assumed initial condition of our universe as an isotropic and homogeneous exponentially expanding universe?

**DOES IT SATISFY THE BOUNDS IN INHOMOGENEITIES
AND ANISOTROPIES FOR INFLATION TO HAPPEN?**

To answer this question, we need **quantum gravitational observables** capable of measuring **homogeneity** and **isotropy** that we can compute in these quantum geometries!

Definition of Homogeneity

Agustín Silva,
Renate Loll

Triangulations (CDT)
De Sitter Universe =
Emergent universe
from CDT ?

Homogeneity Observables

Definition of Homogeneity

Scale Dependent
Homogeneity

Homogeneity with
no coordinates

Toy model
application: 2D CDT

Isotropy Observables

Definition of Isotropy

How the story goes
for Isotropy

Conclusions

Homogeneous Space

*Translation Symmetry of
all its properties*

Difficulties:

- There is no notion of group action and neither of tensor calculus in these quantum geometries.
- Too restrictive definition. In physics, symmetries, like homogeneity, can emerge at certain scales.

Solutions:

- We will use a statistical definition of homogeneity, needing only a distance measure in the space.
- We will define observables capable of testing this symmetry at different scales.

Scale Dependent Homogeneity

Agustín Silva,
Renate Loll

Motivation

Causal Dynamical
Triangulations (CDT)
De Sitter Universe =
Emergent universe
from CDT ?

Homogeneity Observables

Definition of
Homogeneity

Scale Dependent Homogeneity

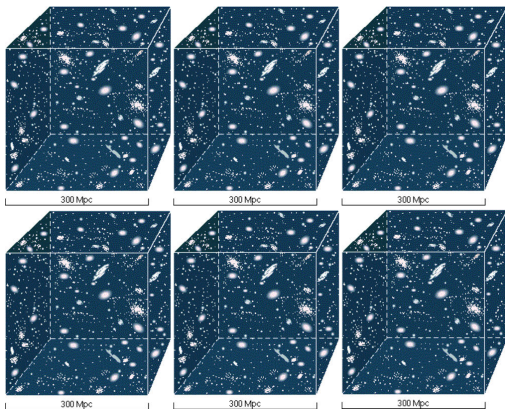

Homogeneity with
no coordinates

Toy model
application: 2D CDT

Isotropy Observables

Definition of Isotropy
How the story goes
for Isotropy

Conclusions

Homogeneity appears only at a certain scale in our universe. It is an "emergent" symmetry, as the result of a statistical study of its properties at different scales. Let's try to do the same in a quantum universe!

Coarse-graining for Homogeneity

Agustín Silva,
Renate Loll

Motivation

Causal Dynamical
Triangulations (CDT)
De Sitter Universe =
Emergent universe
form CDT ?

Homogeneity Observables

Definition of
Homogeneity

Scale Dependent Homogeneity

Homogeneity with
no coordinates

Toy model
application: 2D CDT

Isotropy Observables

Definition of Isotropy

How the story goes
for Isotropy

Conclusions

We use geodesic spheres as chunks of the universe, to average properties $Q(x)$. In a flat space, this coarse-graining imposes a momentum cut-off $\Lambda \simeq \frac{1}{\delta}$. In this sense, we are covariantly "washing out" high energy details, and keeping only a coarse-grained value of property at a certain scale δ .

Coarse-graining for Homogeneity

Isotropy Observables

Definition of Isotropy
How the story goes
for Isotropy

Conclusions

- We defined quantum gravitational observables capable of determining % deviations from perfect homogeneity and isotropy of spacetime.
- The observables are capable of being implemented in highly fluctuating spacetimes, and do not require smoothness of the space nor the existence of tensor calculus, but only need the existence of a distance measure and a volume measure.
- We implemented these observables in the quantum geometries obtained in 2D quantum gravity using Causal Dynamical Triangulations, obtaining results compatible with inhomogeneities and anisotropies in the continuum limit of the theory.
- These observables will be implemented in 4D Causal Dynamical Triangulations, to characterize the inhomogeneities and anisotropies of its De Sitter like emergent universe.
- A positive outcome for the implementation in 4D CDT would be that our observables indicate a universe compatible with the initial conditions of inflation. Such results could be used to justify the usually assumed initial conditions of the universe in inflation.
